Imaging tests for lower back pain
When you need them—and when you don’t

Back pain can be excruciating. So it seems that getting an X-ray, CT scan, or MRI to find the cause would be a good idea. But that’s usually not the case, at least at first. Here’s why:

They don’t help you get better faster. Most people with lower back pain feel better in about a month whether they get an imaging test or not. In fact, those tests can lead to additional procedures that complicate recovery. For example, one large study of people with back pain found that those who had imaging tests soon after reporting the problem fared no better and sometimes did worse than people who took simple steps like applying heat, staying active, and taking an over-the-counter (OTC) pain reliever. Another study found that back pain sufferers who had an MRI in the first month were eight times more likely to have surgery, but didn’t recover faster.
How should you treat lower back pain?

Your doctor can advise you on how best to treat your lower back pain. Most people get over back pain in a few weeks, and these simple steps might help:

**Stay active.** Resting in bed for more than a day or so can cause stiffness, weakness, depression, and slow recovery.

**Apply heat.** A heating pad, electric blanket, or warm bath or shower relaxes muscles.

**Consider over-the-counter medicines.** Good options include pain relievers such as acetaminophen (Tylenol and generic) or anti-inflammatory drugs such as ibuprofen (Advil and generic) and naproxen (Aleve and generic).

**Sleep comfortably.** Lying on your side with a pillow between your knees or lying on your back with a few pillows beneath your knees might help.

**Talk with your doctor.** If symptoms don’t improve after a few days, consider seeing a doctor to make sure that the problem doesn’t stem from a serious underlying health problem. If the pain is severe, ask about prescription pain relievers.
